

$$\textcircled{5} \quad x - 3y = 2, \quad -2x + 6y = 5$$

$$\frac{a_1}{a_2} = \frac{1}{-2} \quad \left| \quad \frac{b_1}{b_2} = \frac{-3}{6} \quad \left| \quad \frac{c_1}{c_2} = \frac{2}{5} \right. \right.$$

$$= -\frac{1}{2} \quad \left| \quad = -\frac{1}{2} \quad \left| \quad \right. \right.$$

$$\therefore \frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$$

$\therefore$  paths do not cross each other.

$$\textcircled{6} \quad x = -1, \quad y = 3$$

reqd. pair of eqns  $x + y = 2$   
 $2x + y = 1$

Inf. Many such pair are possible.

$$\textcircled{7} \quad 2x + y = 23, \quad 4x - y = 19 \quad \text{---} \textcircled{1}$$

$$\textcircled{1} + \textcircled{1}$$

$$\begin{array}{r} 2x + y = 23 \\ 4x - y = 19 \\ \hline \end{array}$$

$$6x = 42$$

$$\Rightarrow x = \frac{42}{6}$$

$$= 7$$

Sub  $\textcircled{1}$

$$2 \times 7 + y = 23$$

$$y = 23 - 14$$

$$= 9$$

$$\therefore x = 7, \quad y = 9$$

$$\begin{aligned} \text{(a)} \quad & 5y - 2x \\ & = 5 \times 9 - 2 \times 7 \\ & = 45 - 14 \\ & = 31 \end{aligned}$$

$$\begin{aligned} \text{(b)} \quad & \frac{y}{x} - 2 \\ & \frac{9}{7} - 2 \\ & = \frac{9 - 14}{7} \\ & = -\frac{5}{7} \end{aligned}$$
